CLEAR CHOICE TEST

By Sam Stover, Network World, 10/17/05

Guidance Software's most recent release of EnCase Enterprise puts incident-response capabilities into the IT security manager's toolbox. In our Clear Choice Test, we found that with this aggregation of incident-response and forensic capabilities not yet seen in competing products, EnCase Enterprise can (for a pretty big price tag) help a network investigator establish relationships between open ports, open files, network connections, hidden files or processes and malicious network activity.

Tapping IDS for automated incident response

EVENTS

Unix and Linux administrators are always going to have tools/utilities such as lsof (list open files), netstat (list open ports and more), bvi (binary file editing) and a bevy of other (even more capable) incident-response tools. However, that approach is limited in a corporate environment by the effort required to coordinate these disparate tools.

<p>Best Products Issue NEW</p> <p>Enterprise All-star NEW 2006 nominations now open</p> <p>New Data Center</p> <p>IT NEW</p> <p>Next-generation</p>	<p>Enterprise Examiner ENTERPRISE EXAMINER BES</p> <p>A primary tenet of incident response built into EnCase Enterprise is the ability to remove from consideration, as fast as possible, the "known good," be it ports, files, processes, log entries or even registry entries. The faster an analyst can filter through what is known and focus on what is unknown, the shorter the investigation time. In some enterprise environments, IDS alerts can easily number in the tens of thousands each day. In most cases, at least a token investigation beyond the information provided by the IDS is required to determine whether the event is a false positive or warrants further attention. The easier it is for an analyst to make this decision, the more efficient the entire system becomes. EnCase Enterprise is capable of providing the information an analyst needs to make such a decision.</p> <p>The three main mechanisms for sorting out the unknown information are Filters, EnScripts and Conditions. Guidance provides defaults for each of these, but the user can add more.</p> <p>We found EnCase Enterprise filters to be very basic, handling file permissions, deleted files and specific types of Web pages.</p> <p>EnScript is a proprietary language that lets you build code for complex activities, such as collecting data from the Servlet, initializing databases and setting up filter combinations. The name of the EnScript that polls data from the Servlet is Enterprise Sweep. By default, it captures only port, file, process and physical system information. However, the user is presented with approximately 25 optional modules for data collection that can be selected. For example, in our tests we retrieved log files for Windows and Linux via</p>

[Secure Enterprise Wireless: Today's Management Challenges - Siemens](#)

For a century, over-the-air transmission has been so fundamental to the evolution of technology that today's world would be impossible without it. Yet it has only been recently that wireless has been successfully introduced as a convenient and reliable local-area network (LAN) technology in the enterprise. Why the long wait? The answer can largely be reduced to two words: reliability and security. This special report examines some of the issues that confront today's enterprise as it meets the wireless challenge.
